(c) Using the books.xml file you created earlier, write an XQuery expression that transforms the XML data into a formatted HTML document.

The screenshot shows an XQuery editor window titled 'file2*' with a toolbar at the top. The editor contains an XQuery expression that reads from 'books.xml' and generates an HTML document. The expression uses a 'for' loop to iterate over each book element, grouping the title, author, and year into a list item. The result pane below shows the output of the query, which is a single HTML document containing a list of six books. The browser window at the bottom shows the file path 'file:///C:/Rabin Moktan/Lab37c.html'.

```
1 <html>
2   <head>
3     <title>Book List</title> </head>
4   <body>
5     <h1>Books</h1>
6     <ul>
7   { for $b in doc("books.xml")/books/book
8     return
9       <li>
10        [ $b/title/text() ] by { $b/
11        author/text() } ({ $b/year/text() })
12      </li> }
13   </ul> </body> </html>
```

OK 10 : 28

1 Result, 418 b Result

```
<html><head><title>Book List</title></head><

WEB LAB 25–32 Ultra Short Notes

Lab 25: Event Handling

onclick, addEventListener, mouse events, keyboard events, form events, window events.

Lab 26: DOM

nodeName, nodeType, nodeValue, parentNode, childNodes, getElementById(), querySelector(), createElement(), appendChild(), setAttribute().

Lab 27: Regex

Methods: exec(), test(), match(), matchAll(), search(), replace(), split(). Email regex, phone regex, uppercase check.

Lab 28(a): Forms

document.forms['formName'], form['field'].value

Lab 28(b): Validation

Name alphabets only, phone 10 digits, valid email, username 6-15 chars, strong password, confirm password.

Lab 29: Calculator

press(), calculate(), clearDisplay(), deleteLast(), eval().

Lab 30: Cookies

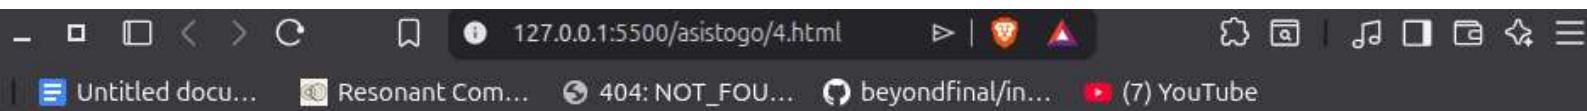

Create, Read, Change, Delete cookies using document.cookie.

Lab 31: jQuery

Selectors: \$('p'), \$('.class'), \$('#id'). Events: click, dblclick. Effects: hide, show, toggle, fadeIn, fadeOut, slideUp, slideDown.

Lab 32: JSON

JSON object, JSON.stringify(), fetch(), push() to add data.

Meta Tags Demonstration

This HTML page is created to demonstrate the usage of various meta tags such as charset, description, keywords, author, viewport, and refresh.

	WT	DBMS	CN
Ram Sharma	85	80	78
Sita Karki	75	88	82
All marks are out of 100			

Lab No.1(d) by Raman Thapa, Roll No:88, Section:C

My top 5 Favorite Movies

1. Pulp Fiction
2. Memories Of Murder
3. Kung Fu Panda
4. Eternal Sunshine Of The Spotless Mind
5. Chino

Favorite Hobbies

- Programming
- Listening to music
- Playing Guitar
- Gaming
- Sleeping

Programming Languages and Their Uses

HTML:

Used to structure content on the web.

CSS:

Used to style and design web pages.

JavaScript:

Used to create interactive web applications.

Python:

Used for data science, automation, and web development.

Java:

Used for desktop, mobile, and enterprise applications.

Lab No.1(c) by Raman Thapa, Roll No:88, Section:C

Lab No.1(b) by Raman Thapa, Roll No:88, Section:C

HTML Basics

Document Structure

Headings

Sub Topics

Minor Topics

Additional Notes

HTML stands for **HyperText Markup Language**. It is used to create and structure content on the web.

This paragraph demonstrates text formatting such as bold, italic, and emphasized text.

Highlighted text helps draw attention, while small text is used for less important information.

~~Old content~~ has been removed and new content has been added.

Chemical formula: H_2SO_4

Mathematical expression: $x^2 + y^2$

Preformatted Text Example

HTML preserves spaces
and line breaks
exactly as written.

This line uses a line break
to move text to the next line.

Lab No.1(b) by Raman Thapa, Roll No:88, Section:C
